AAD ANNUAL MEETING
AEDV
highlights

SAN DIEGO 
8-12 MARZO

**NO TENGO CONFLICTOS
DE INTERÉS**

3 sesiones y 22 pósteres en total.

- Fotodermatitis de contacto y condiciones relacionadas
 - Claves para el diagnóstico diferencial
 - Recomendaciones sobre fotopatch-testing
 - Fotodermatosis idiopáticas
 - Peculiaridades en piel negra
- Terapia fotodinámica, fototerapia y fotoprotección
 - Novedades
 - Mitos y controversias sobre fotoprotección
 - “Fotoprotección personalizada”

Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

- Fotosensibilidad: 2 motivos. Respuesta anómala por absorción de cromóforos endógenos vs respuesta esperada por sustancias fotosensibilizantes conocidas.
- Causas tan variadas que requiere una anamnesis y exploración exhaustivas. Tiempo y concentración en piel dependiente: preguntar por fármacos hasta el primer episodio y **no solo los nuevos**.
- Patrón clínico áreas fotoexpuestas. **IMPORTANTE** áreas respetadas para diagnóstico diferencial con dermatitis de contacto aerotransportada (holofacial) vs erupción polimorfa lumínica (respeto cara).

Characteristically spares

- Upper eyelids
- Nasolabial folds
- Submental area
- Retroauricular folds

DDx: Airborne Contact Dermatitis

(Methylisothiazolinone in freshly painted home)

AEDV

SAN DIEGO
8-12 MARZO

- Diagnóstico diferencial: fotosensibles vs no fotosensibles
- Casi siempre **diagnóstico clínico**. Biopsia en casos muy concretos, no suele ser específica. Importancia del fotoparche.
- *Photodrug reactions*: más frecuente daño tisular directo que fotoalergia. Fármacos responsables. No estudios complementarios.
- Fotodermatitis de contacto: tóxica vs alérgica. Ambos por UVA. Causas tóxica: fitocumarinas, psoralenos. Causas alérgica: cambios con los años. Actual: fotoprotectores orgánicos (dx/d DAC a excipientes) y AINES tópicos (causa + frec en Europa).

Sunscreen Sensitivity: Pearls

- Sunscreen inactive ingredients (esp. fragrances and preservatives) commonly cause routine (non-photo) ACD
- UV filters are found in many non-sunscreen products (e.g., cosmetics, shampoos, lip balms) → may complicate presentation
- Sunscreens cause more ICD than ACD
 - Can't truly prove it unless you photopatch test – ideally also test the patient's own sunscreens

NSAIDs

- Top cause of photocontact allergy in Europe; uncommon in N. America
 - Why? Most agents not approved here
- Ketoprofen
 - Can cross-react with certain sunscreens (oxybenzone, octocrylene), fenofibrate for hyperlipidemia
- Etofenamate
- Piroxicam
- **Diclofenac** (OTC in N. America)

Diagnosis

Clinical

Photopatch test

Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

AAD ANNUAL MEETING

AEDV

SAN DIEGO
8-12 MARZO

- FOTOPARCHE: disponible en pocos lugares. Menos alérgenos que la batería estándar (≈ 40). Se pueden solicitar a la industria. Protocolo.
- Dosis mínima eritematogena: FUNDAMENTAL. Proceso fotosensible subyacente. Normal en EPL y alterado en dermatitis actínica crónica, prurigo actínico y dermatitis atópica fotoagravada.
- Parches aplicados por duplicado. Se irradia solo uno de ellos. En USA aplican UVA 10J/cm². En Europa 5J/cm² (consideran insuficiente, falsos negativos).
- Lectura final: 3 escenarios. **¿A quién sí/no?**
- Manejo: evitación, sustitución y tto brote.

Management of Photocontact Dermatitis

- Consists primarily of AVOIDANCE of the culprit (as in routine ACD)
- + Photoprotection including sunscreens to which patient is not sensitized
- Adjunctive topical/systemic treatments as needed

Who Not to Photopatch Test?

- Unambiguous cases of phototoxic contact dermatitis (e.g., classic phytophotodermatitis) do not require photopatch testing
 - Clinical diagnosis
- Do NOT photopatch test to lime or other known phototoxic substances

Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

~~~~~

- Dermatitis atópica fotoagravada: reto diagnóstico dx/d dermatitis actínica crónica
- Fotodermatosis idiopáticas: EPL, dermatitis actínica crónica y prurigo actínico.

## Photoaggravated Atopic Dermatitis

- Consider in AD patients with:
  - Seasonal worsening
  - Photodistributed eczema
  - Flares associated with sun exposure or phototherapy
- Action spectrum primarily in UVA > UVB or visible range
- Challenging to distinguish from chronic actinic dermatitis

Keck Medicine of USC

JAMA Dermatol. 2022 Sep 1;158(9):1022-1030.  
J Eur Acad Dermatol Venereol. 2016 Feb;30(2):270-5.

# Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

## PMLE: Treatment

- Broad spectrum sunscreen and physical protection
- Prophylactic photohardening before first intense sun of the year (most commonly NBUVB)
- Medications
  - Topical steroids
  - Hydroxychloroquine
  - Oral steroids for severe flares, or steroids
- *Polypodium leucotomos* extract
- Prognosis: some patients improve over time

## PMLE: Clinical Features

- F>M, onset 2<sup>nd</sup>-3<sup>rd</sup> decades, **all skin types**
- Classic onset: springtime or vacation
  - Usually starts within hours of sun

## PMLE: Treatment

- Oral photoprotection with *Polypodium leucotomos* extract
- OTC supplement – Central/South American fern
- Rich in polyphenol antioxidants
- Non-randomized studies: may prevent or reduce symptoms of PMLE
- Negligible side effects

## PMLE: Clinical Features

- Morphologies: polymorphous between individuals for each person (usually)
  - Papular/urticarial
  - **Darker skin types – pinpoint papular**
  - Large papules or plaques
  - Vesicular / bullous
  - Eczematous
  - Edematous
  - Erythema multiforme-like
- Variant: juvenile spring eruption (helices in kids)

... (“hardening”)

... al hands, arms, neck, V chest > face

... onally burning

Keck Medicine of USC

J Clin Aesthet Dermatol. 2021 Feb;14(2):50-60.

... ated +ANA without systemic symptoms; does

- Histology: non-specific and depends on clinical morphology (perivascular lymphocytic, dermal edema, spongiosis)
- Phototesting: normal minimal erythema dose (MED) responses
  - Photoprovocation testing (repeated UV doses over days) can reproduce lesions, confirm dx

# Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

## Chronic Actinic Dermatitis (CAD)

- AKA actinic reticuloid, persistent light reactivity
- Action spectrum: UVB, UVA, visible
- Etiology (proposed): type IV hypersensitivity reaction to photoinduced antigen in skin

## CAD: Clinical Features

- **Chronic and persistent year-round symptoms**
  - Affected individual may not associate with sun exposure
- Severe cases can involve photoprotected body sites
- Morphologies
  - Eczematous
  - Lichenified
  - Infiltrated or lymphoma-like plaques, leonine facies
  - Rarely, erythrodermic
- Pruritic

## CAD: Diagnosis

- Histology
  - Spongiotic dermatitis
  - Acanthosis
  - Lymphohistiocytic infiltrate
  - May mimic CTCL
- Phototesting: abnormal MEDs (UVA, UVB, and/or visible)
- Photopatch test important to rule out concomitant (photo)allergic contact dermatitis

## CAD: Treatment

- **Education:** year-round symptoms → still need strict photoprotection
- Broad spectrum sunscreen, physical protection
- UV blocking window films
- Medications
  - Topical steroids/calcineurin inhibitors
  - Severe disease: systemic steroids, steroid-sparing agents, **dupilumab**
- Phototherapy
- Allergen avoidance if concomitant allergic contact dermatitis
- Prognosis: variable, ~20% resolution over 10 years

# Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

## Actinic Prurigo: Diagnosis

- Histology nonspecific except **lip biopsy showing follicular cheilitis is characteristic** (pathognomonic?)
- Phototesting: reduced MED to UVA/UVB
- Photopatch testing to rule out photocontact allergy
- HLA typing

## Actinic Prurigo: Treatment

- Broad spectrum sunscreen and physical protection
- UV blocking window films
- Medications
  - Topical steroids/calcineurin inhibitors
  - Severe disease: systemic steroids (brief courses), steroid-sparing agents, **thalidomide** (caution teratogenicity)
  - Case reports: successful use of **dupilumab**
- Phototherapy
- Prognosis: often resolves by adolescence, but can persist

## Actinic Prurigo Cheilitis

Lower lip predominance  
\*May present with isolated cheilitis

## Actinic Prurigo: Clinical Morphologies

- Papules
- Plaques
- Nodules (prurigo-like)
- Lichenification
- Hemorrhagic crusting
- Pitted scars

# Fun in the sun: photocontact dermatitis and related conditions – Brandon Adler y Vincent DeLeo

SAN DIEGO  
8-12 MARZO

- Fotodermatosis en piel negra: falsa creencia estas patologías solo a pieles blancas.
- Serie de casos (Maghfour, 2023): 844 pacientes con EPL o dermatitis actínica crónica. Fototipo IV-VI 74% con EPL y 72% DAC.
- Serie de casos UK (Tan, 2017): 70 pacientes DAC, ≈50% V-VI. Más frecuente en mujeres y desarrollo 12 años antes que la media en pacientes con fototipos oscuros.
- Mensaje: considerar dermatitis actínica crónica en mujeres jóvenes con piel negra entre otros posibles diagnósticos.

## Photodermatoses in Skin of Color

- We may falsely assume photosensitivity is limited to patients with lower skin phototypes (SPT)
- Maghfour et al 2023 (US)
  - 844 pts with PMLE or CAD
  - Demographics
    - >50% of clinic population was white
    - PMLE (n=725): 74% of patients were SPT IV-VI (26% SPT I-III)
    - CAD (n=60): 72% were SPT IV-VI (28% SPT I-III)

A substantial proportion of PMLE and CAD cases present in patients with skin of color

Keck Medicine of USC

Photodermatol Photoimmunol Photomed. 2023 Mar;39(2):93-99.

## Photodermatoses in Skin of Color

- We may falsely assume photosensitivity is limited to patients with lower skin phototypes (SPT)
- Tan et al 2017 (UK)
  - 70 pts with CAD: close to half had SPT V-VI
  - Darker skin types associated with 12-year earlier onset of photosensitivity vs lighter skin types (36 vs 48 yo, P=0.01)
  - M:F ratio
    - 2:1 among lighter skin types
    - 1:2 among darker skin types

CAD may present in young women with skin of color

Keck Medicine of USC

JAMA Dermatol. 2017 May 1;153(5):427-435.

# Terapia fotodinámica (Cleveland University)

## Review of Modified “Painless” Photodynamic Therapy, Why it Works, and Future Directions

Jessica Johnson, BS<sup>1</sup>, Edward Maytin, MD, PhD<sup>1,2</sup>  
<sup>1</sup>Cleveland Clinic Lerner College of Medicine of Case Western Reserve University, Cleveland, Ohio, U.S.A.

 Disclosures & Commercial Support: NIH Grant P01 CA084203; IIT grant from Biofrontera Inc.

- Revisión de TFP modificada con luz azul o roja (cortos periodos de incubación) vs convencional (3-4 h de incubación): resultados de eficacia equivalentes y reducción significativa del dolor.
- Hipótesis de mecanismo de acción a través de reclutamientos de células inmunes frente a muerte celular inducida por la TFD convencional.
- Limitaciones: bajo tamaño muestral luz roja (actualmente la más empleada en nuestro medio) y tiempos de seguimiento.

**Background**  
 PDT uses a photosensitizing drug, 5-aminolevulinic acid (ALA) or methyl aminolevulinate (MAL), and an artificial light source to target neoplastic lesions in an entire skin field. The photosensitizing drug can be activated via blue (405nm) or red (633nm) light. The downside of most current PDT treatment protocols (conventional PDT; c-PDT), are the photosensitizer's long incubation times (~3-4 hours) and the stinging pain. However, recent studies suggest that shorter incubation times during PDT (modified PDT; m-PDT) can reduce pain and have similar efficacy. These m-PDT protocols have been utilized with both blue light and red light. Herein we review the various studies utilizing m-PDT and provide mechanistic explanation for the similar efficacy to c-PDT.

**Methods**  
 We completed a review of the current literature in late 2023 and found 5 human studies utilizing m-PDT protocols with blue light illumination and 2 human studies utilizing m-PDT protocols with red light illumination, alongside one clinical trial utilizing red light illumination that is underway. We report the pain ratings and efficacy in reducing AK lesions for these studies. All studies utilized ALA as the photosensitizing agent, except where specified.

\*Pain during m-PDT was significantly lower than for c-PDT  
 \*\*m-PDT was statistically non-inferior to c-PDT and pain score was significantly lower for m-PDT compared to c-PDT  
 \*\*\*Clinical trial is underway so all data presented are preliminary

**Potential Mechanism of m-PDT**  
 Previously, the hypothesis had been that extensive incubation times for the photosensitizing medication, and the associated pain, were necessary for AK lesion clearance. Studies listed here suggest this is not the case. Recent mice studies have found that instead of generating reactive oxygen species and inducing cell death as in c-PDT, the m-PDT protocol appears to work through immune cell recruitment.<sup>9</sup> These immune cells appear by 24 hours post treatment and persist for 1-2 weeks. Thus, the immune response, which is triggered by m-PDT, could largely be responsible for the reduction in AK lesions rather than the traditionally assumed apoptotic pathways.

**Future Directions**  
 Future studies in human AK lesions are needed to further define the mechanisms of m-PDT. Regardless, the studies highlighted above suggest that m-PDT protocols are efficacious in reducing AK lesions, when compared to c-PDT, and provide a major improvement in tolerability for patients.

# How to deliver phototherapy in 2024 – Sunil Kalia, University of British Columbia

## Evaluating adherence with phototherapy

- 851 patients with **psoriasis**
- 106 patients with **vitiligo**
- **Adherence rates:** (20 psoriasis, 60 vitiligo sessions)
  - Psoriasis: 47%
  - Vitiligo: 61%

- **Age and distance from clinic most important variables for adherence**

Kalia et al, JAAD 2014

## Type of home phototherapy devices

- 3D panel

- Single Panel

- Localized

## Low risk of skin cancer with UV phototherapy – recent studies

**Psoriasis** – NB-UVB therapy =22,891 pt  
- Lin et al, PPP 2019

**Vitiligo** – NB-UVB meta-analysis, n=110,038 pt  
- Wu et al, Clin Exp Derm 2021

**Uremic pruritus** – UVB therapy, n=10,805 pt  
- Ko et al, Acta DV 2021

**Eczema** – NB or BB-UVB or UVA, n=925 pt  
- Ahad et al, JAAD 2022

**Meta-analysis** (n=71,479 patients)

- Overall risk of skin cancer =0.99 (95%: 0.75-1.32)

## Summary– Phototherapy in 2024

- **Home phototherapy is equally efficacious and safe**
- **Type of devices for home phototherapy**
- **Skin cancer risk is not increased with UVB therapy**

- Fotoprotectores son considerados MEDICAMENTOS en USA. En Europa se consideran cosméticos.
- Consideración de medicamento = riguroso control sanitario. Solo 9 utilizados en USA. Prioridad eficacia y seguridad.
- **SPF  $\geq$  30** (UVB, UVAII, más superficiales, generan eritema, estudios in vivo, medida objetiva del fototipo). Entre SPF 15 y 30 se reduce 50% UV absorbido.
- **Amplio espectro** (UVB+UVA), UVAI efectos no visibles a corto plazo (fotoenvejecimiento, pigmentación), estudios in vitro, *critical wavelength*. Misma CW no implica igual fotoprotección frente a UVAI, NUEVO criterio propuesto: ratio UVAI/UV  $\geq$  0,7.
- **LUZ VISIBLE:** no cubierta en fotoprotectores habituales. Induce hiperpigmentación en fototipos oscuros, efecto sinérgico UVAI, en desarrollo nuevos métodos de evaluación.

## Impact of other wavelengths: Visible Light (VL) Effects: Dark Skin (Mahmoud et al. JID 2010)

VL shown to induce erythema and pigmentation in melanocompetent individuals

39

HENRY FORD HEALTH +  
MICHIGAN STATE UNIVERSITY  
Health Sciences

## Current VL Phototesting Methodologies: Proposed Harmonization (Lim et al JID 2021)

- Single exposure model
  - ✓ Similar to UVA and UVB testing
  - ✓ Multiple visits method:
    - May result in higher subject dropout
    - May introduce additional variables: daily product application
- VL-PF pigmentation: one time point Day 7

$$VL - PF = \frac{\Delta ITA_{untreated}}{\Delta ITA_{treated}}$$

# FOTOPROTECCIÓN – LUZ VISIBLE

- Luz azul, principal responsable de la pigmentación. Interactúa con Opsina-3 induciendo una actividad aumentada de la tirosinasa.
- Estimula la pigmentación de manera aislada en pieles oscuras, y en sinergia con la UVA1 en pieles claras.
- Protección frente a luz visible: fotoprotectores “tintados” (óxido de hierro), antioxidantes y agentes orales (*Polypodium leucotomos*). Limitaciones: tinte mancha y pocos estudios.

Lim, HW, Kohli, I, Granger, C, ..... Krutmann, J, Passeron, T. J Invest Dermatol. 2021 Nov;141:2569

## Protection against VL and Longwave UVA1

- Tinted sunscreens
- New filters
- Antioxidants
- Oral agents

## Topical Antioxidants and VL+UVA1

(Lyons, AB, ... Ruvolo, E, Lim, HW, Hamzavi, IH. Photochem Photobiol 2022 Mar;98(2):455)

Figure 2. Photographs of sites immediately, 24 h and 7 days after VL-UVA1 irradiation for subjects with (a) SPT I-III and (b) SPT IV-VI.

AO (2%), vs control:

- SPT I-III: decreased erythema
- SPT IV-VI: decreased IPD, PPD and delayed tanning

## VL: Blue light and Opsin-3

(Duteil, L, ... Passeron, T. Pigment Cell Melanoma Res 2014; 822. Nice, France. Regazzetti, C, ... Passeron, T. J Invest Dermatol 2018; 138:171. Nice, France)

- Action spectrum: blue light
- Opsin-3 is the key sensor in melanocytes
- Blue light + Opsin-3:
  - Formation of tyrosinase/tyrosinase-related protein complex
  - Mainly formed in melanocytes from dark-skinned individuals
  - Induces a sustained tyrosinase activity

# Mitos y controversias sobre fotoprotección

- No es necesario recomendar aplicación 30 minutos antes. Todos los fotoprotectores comercializados actúan desde su aplicación.
- Solo reaplicar cada 2-3 horas si se transpira mucho o se moja.
- Es incorrecto llamar a los fotoprotectores físicos o químicos por su interacción con la radiación, los “físicos” reflejan y absorben luz UV. Más correcto decir: orgánico vs mineral o soluble vs insoluble.
- Se ha demostrado absorción de algunos fotoprotectores, pero ningún estudio ha demostrado efectos perjudiciales hasta la fecha (aumenta el cáncer no usarlos).
- No se ha demostrado impacto medioambiental en las condiciones habituales de uso de los fotoprotectores.

## Sunscreens and Oxybenzone

- Concerns have been raised regarding the environmental effects of commonly used organic ultraviolet (UV) filters, including oxybenzone (benzophenone-3)
- In laboratory settings, oxybenzone has been implicated as a possible contributor to coral reef bleaching.
- Has been identified in various species of fish worldwide
- In July 2018, the Hawaii Governor signed a law prohibiting sale and distribution of sunscreens containing oxybenzone (took effect in 2021)
- In 2019, Key West, FL also banned this. But other municipalities have rejected the ban and the Florida Legislature overturned the local ban.
- *Conclusion:*
  - *Concern about the environmental impact of organic UV filters should not detract from educating the public on the importance of photoprotection*

Schneider et al, JAAD, 2019

## Is the absorption of sunscreen filters a problem?

- The arbitrary selection of an upper limit of 0.5ng/mL is also problematic.
- *There are no studies or data to support that concentration in the blood is a risk-specific level for sunscreens.*

Litchman et al, SKIN J Cutan Med, 2019

**Figure 1** Spectral absorption profiles of sunscreens suitable for different skin phototypes. This figure represents the absorption profile of sunscreen recommended for healthy individuals with different skin phototypes for the prevention of skin cancers and photoaging. The latitude of where the individual lives should also be taken in consideration. Individuals with skin conditions (such as photodermatoses or pigmentary disorders) should follow the specific recommendations described in Table 1. ITA individual typology angle, SPF sun protection factor, UVA-PF ultraviolet A, VL visible light, PF protection factor.
